1.0. Introduction

The purpose of this document is to describe in detail the features and functions of the ACS Smart Card Operating System Version 6 Security Access Module (ACOS6-SAM) developed by Advanced Card System Ltd.

1.1. Features

ACOS6-SAM provides the following features:

- Compliance with ISO 7816 Parts 1, 2, 3, 4
- High baud rate switchable from 9600 to 223,200 bps.
- Full 64 K of EEPROM memory for application data.
- Supports ISO7816 Part 4 file structures: Transparent, Linear fixed, Linear Variable, Cyclic.
- DES / Triple DES capability.
- Hardware based random number generator compliant to FIPS140-2
- Mutual authentication with session key generation.
- Secure Messaging ensures data transfers are confidential and authenticated.
- Secure Access Module pairs with ACOS2, ACOS3 and ACOS6.
- Stores and performs all key operations on ACOS2/3/6 including mutual authentication, encrypted PIN submission, secure messaging, and ePurse commands
- Multilevel secured access hierarchy.
- Anti-tearing done on file headers and PIN commands.

1.2. Technical Specifications

The following are some technical properties of the ACOS6 card:

1.2.1. Electrical

- Operating at 5V DC +/-10% (Class A) and 3V DC +/-10% (Class B)
- Maximum supply current: <10 mA
- ESD protection: ≤ 4 KV

1.2.2. EEPROM

- Capacity: 64 Kbytes (65.536 bytes)
- EEPROM endurance: 100K erase/write cycles
- Data retention: 10 years

1.2.3. Environmental

- Operating temperature: -25 °C to 85 °C
- Storage temperature: -40 °C to 100 °C

1.3. Symbols and Abbreviations

3DES	Triple DES
AID	Application / Account Identifier
AMB	Access Mode Byte
AMDO	Access Mode Data Object
APDU	Application Protocol Data Unit
ATC	Account Transaction Counter
ATR	Answer To Reset
ATREF	Account Transaction Reference
COMPL	Bit-wise Complement
COS	Card Operating System
DEC(C, K)	Decryption of data C with key K using DES or 3DES
DES	Data Encryption Standard
DF	Dedicated File
ENC(P, K)	Encryption of data P with key K using DES or 3DES
EF	Elementary File
EF1	PIN File
EF2	KEY File
FCP	File Control Parameters
FDB	File Descriptor Byte
LCSI	Life Cycle Status Integer
LSb	Least Significant Bit
LSB	Least Significant Byte
MAC	Message Authentication Code
MF	Master File
MSb	Most Significant Bit
MSB	Most Significant Byte
RFU	Reserved for Future Use
RMAC	Retail MAC
SAC	Security Attribute – Compact
SAE	Security Attribute – Expanded
SAM	Security Authentication Module
SCB	Security Condition Byte
SCDO	Security Condition Data Object
SE	Security Environment
SFI	Short File Identifier
SM-MAC	Secure Messaging with MAC
SM-ENC	Secure Messaging with Encryption
TLV	Tag-Length-Value
TTREFc	Terminal Transaction Reference for Credit
TTREFd	Terminal Transaction Reference for Debit
UQB	Usage Qualifier Byte
	Concatenation

2.0. ACOS6 SAM

ACOS6-SAM is designed to be used as a general cryptogram computation module or as the security authentication module for ACOS2 and ACOS3 client cards. The SAM card securely stores the cryptographic keys and use these keys to compute cryptograms for other applications or smart cards. Using this, the keys never leaves the SAM and the system security would be greatly enhanced. The SAM can also perform the authentication procedure and purse MAC computation for the ACOS2 or ACOS3 cards.

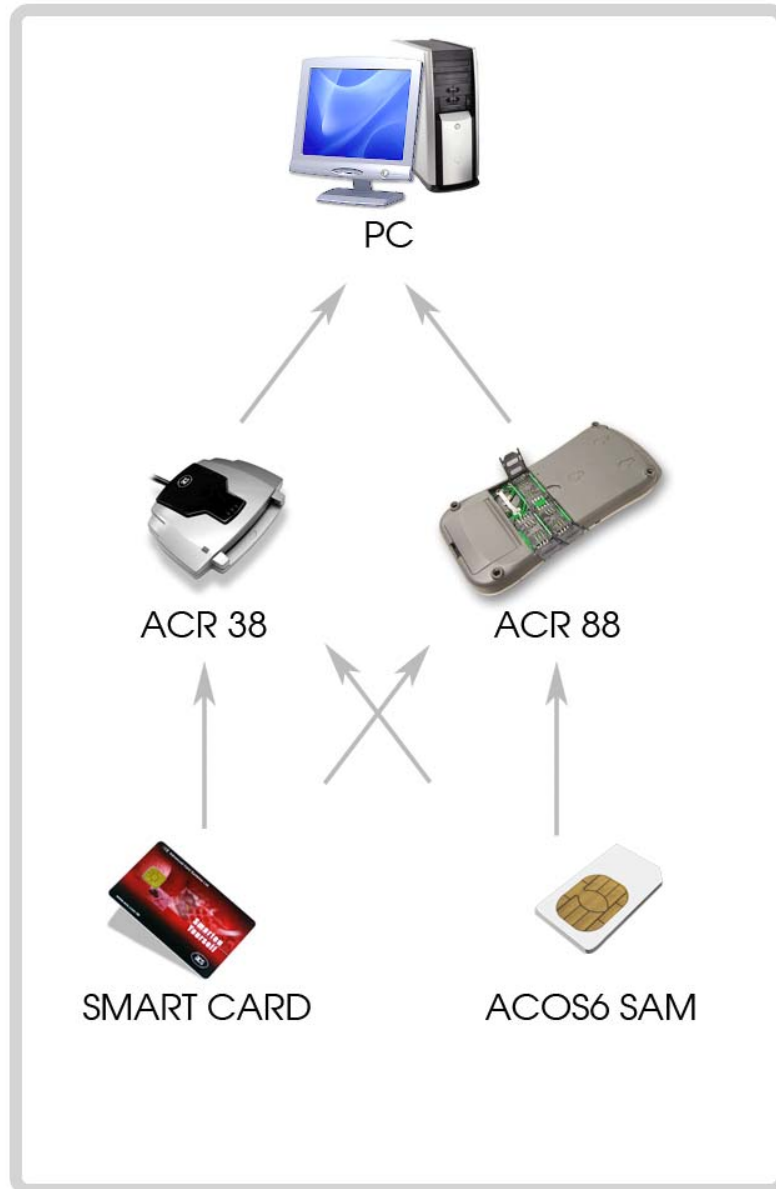

Figure 1: ACOS6-SAM Set-up

- The ACOS6-SAM can be deployed in any application for these purposes:
- To store and secure the application's DES/3DES master keys.

- To generate and derive application keys based on a set of master keys.
- To perform cryptographic functions with client smart cards.
- To use as a secured encryption module.
- When used with ACOS2/ACOS3 client smart cards, ACOS6-SAM can perform the following functions:
 - To initialize the ACOS client card with diversified keys based on the card's serial number.
 - To perform mutual authentication process, and generate of session key.
 - To perform secure messaging with ACOS2/3.
 - To compute the MAC for the PURSE commands.
- The programming method of ACOS6-SAM is different from ACOS2/ACOS3 cards. It is designed to conform to ISO7816 part 4 file system and command set. To get the application developer up to speed, we have included a quick start guide and sample personalization. The following subsections describe the specific SAM functions.

3.0. Card Management

This section outlines the card level features and management functions.

3.1. Anti Tearing

ACOS6-SAM uses an Anti Tearing mechanism in order to protect card from data corruption due to card tearing (i.e., card suddenly pulled out of reader during data update, or reader suffer mechanical failure during card data update). On card reset, ACOS6-SAM looks at the Anti-Tearing fields and does the necessary data recovery. In such case, the COS will return the saved data to its original address in the EEPROM.

3.2. Card Header Block

ACOS6-SAM is a card operating system that has 64K EEPROM. In its initial state (where no file exists), user can access the card header block by using read/write binary with the indicated address.

3.3. Card Life Cycle States

ACOS6-SAM has the following card states:

1. Pre-Personalization State
2. Personalization State
3. User State

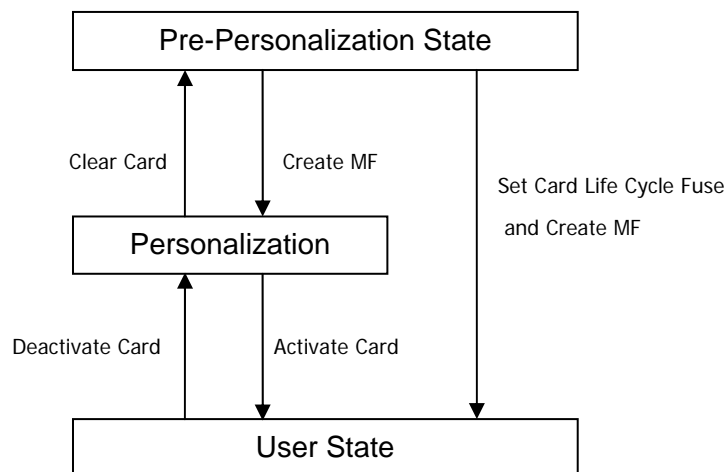

Figure 2: Card Life Cycle States

Pre-Personalization State – is the initial state of the card. The user is allowed to freely access the card header block (defined in Section 3.2). The card header block can be referenced by its address using the READ BINARY or UPDATE BINARY command.

User can personalize the Card’s Header Block as he wishes.

Personalization State – card goes into this state once the MF is successfully created and *Card Life Cycle Fuse* is not blown (still 0xFF). User can no longer directly access the card’s memory as in the previous state. User can create and test files created in the card as if in Operational Mode.

User can perform tests under this state and may revert to the Pre-Personalization State by using the Clear Card command.

User State – Card goes into this state once the MF is successfully created and *Card Life Cycle Fuse* is blown. Alternatively, users can use the Activate Card command to go from the personalization state to user state.

The card cannot revert back to previous states when Card Life Cycle Fuse is set (0x00) and bit 5 of

Special Function Flags (Deactivate Card Enable Flag) is not set. The Clear Card and Deactivate Card commands are no longer operational.

Typical Development Steps of card:

1. User personalizes the card's header block using UPDATE BINARY.
2. User then creates his card file structure, starting with MF. DF's and EF's are created and the card's security design is tested at this state. If design flaws are found, user can always return to state 1 using the CLEAR CARD command.
3. Once the card's file and security design is final and tested, perform Clear Card command and blow the *Card Life Cycle Fuse* using the UPDATE BINARY command (write 0x00 to address 0xEEC7).
4. Card goes into Operational Mode, when the MF is created again. User can then re-construct his file system under this state. Card can no longer go back to previous states.

In ACOS6-SAM revision 4.01 and above, user may choose to set the enable Deactivate Card command in card header block. This allows step 3 and 4 to be replaced by the Activate Card command. If the application developer wishes to clear this card, the Deactivate Card command can be used. To control the access to the deactivate card command, a security attribute can be set to limit this command.

3.4. Answer To Reset

After a hardware reset (e.g. power up), the card transmits an Answer-to-Reset (ATR) in compliance with ISO7816 part 3, and it follows the same format as that of ACOS2. ACOS6-SAM supports the protocol type T=0 in direct convention. The protocol function is not implemented.

For full descriptions of ATR options see ISO 7816 part 3.

3.4.1. Customizing the ATR

Customizing ACOS6-SAM's ATR can set the transmission speed or have specific identification information in the card. The new ATR must be compliant to ISO-7816 Part 3, otherwise the card may become unresponsive and non-recoverable at the next power-up or card reset. Therefore, it is only recommended to change T0 (lower nibble), TA1 and historical bytes.

4.0. File System

This section explores the file system of the ACOS6 SAM smart card.

4.1. Hierarchical File System

ACOS6-SAM is fully compliant to ISO 7816 Part 4 file system and structure. The file system is very similar to that of the modern computer operating system. The root of the file is the Master File (of MF). Each Application or group of data files in the card can be contained in a directory called a Dedicated File (DF). Each DF or MF can store data in Elementary Files (EF).

The ACOS6-SAM allows arbitrary depth DF tree structure. That is, the DFs can be nested. Please see **Error! Reference source not found.** below.

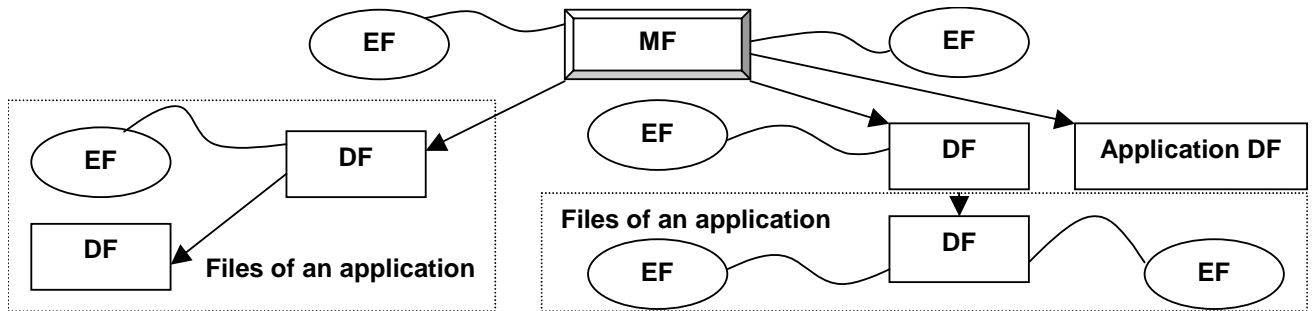

Figure 3: Example of hierarchy of DFs

4.2. File Header Data Structure

ACOS6-SAM organizes the user EEPROM area by files. Every file has a File Header, which is a block of data that describes the file's properties. Knowledge of the file header block will help the application developer accurately plan for the usage of the EEPROM space.

4.2.1. File Descriptor Byte (FDB)

This field indicates the file's type. The size of the File Header block varies depending on the file type.

4.2.2. Data Coded Byte (DCB)

ACOS6-SAM does not use this field. It is part of the header to comply with ISO-7816 part 4.

4.2.3. File ID

This is a 16-bit field that uniquely identifies a file in the MF or a DF. Each file under a DF (or MF) must be unique.

4.2.4. File Size

This is a 16-bit field that specifies the size of the file. It does not include the size of the file header. For record-based EF's, the 1st byte indicates the maximum record length (MRL), while the 2nd indicates the number of records (NOR). For non record-based EF (Transparent EF), the 1st byte represents the high byte of the file size and the 2nd is the low-order byte. For DF's, this field is not used.

4.2.5. Short File Identifier (SFI)

This is a 5-bit value that represents the file's Short ID. ACOS6-SAM allows file referencing through SFI. The last 5 bits of the File ID does not necessarily have to match this SFI. 2 files may have the same SFI under a DF. In such case, ACOS6-SAM will select the one created first.

4.2.6. Life Cycle Status Integer (LCSI)

This byte indicates the life status of the file, as defined in ISO7816 part 4. It can have the following values:

b8	b7	b6	b5	b4	b3	B2	b1	Hex	Meaning
0	0	0	0	0	0	0	1	01	Creation state
0	0	0	0	0	0	1	1	03	Initialization state
0	0	0	0	0	1	-	1	05 or 07	Operational state (activated)
0	0	0	0	0	1	-	0	04 or 06	Operational state (deactivated)
0	0	0	0	1	1	-	-	0C to 0F	Termination state

Table 1: Life Cycle Status Byte

In Creation / Initialization states, all commands to the file will be allowed by the COS.

In Activated state, commands to the file are allowed only if the file's security conditions are met.

In Deactivated state, most commands to the file are not allowed by the COS.

In Terminated State, all commands to the file will not be allowed by the COS.

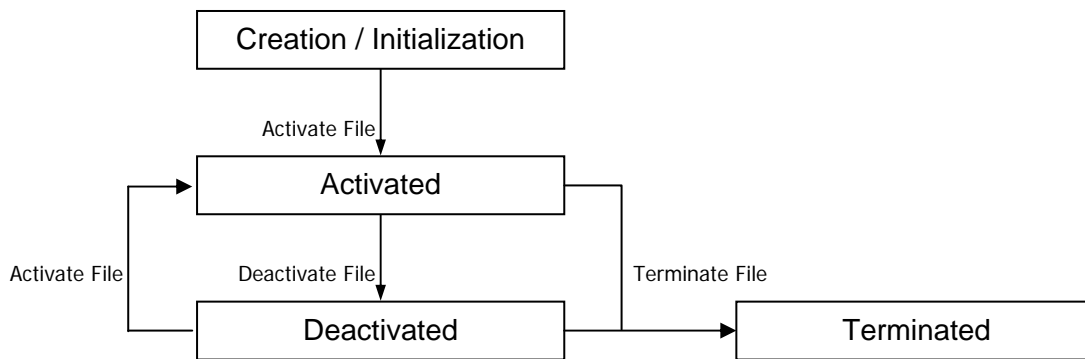

Figure 4: Life Cycle Status Integer

4.2.7. Security Attribute Compact Length (SAC Len)

This byte indicates the length of the SAC structure that is included in the file header below.

4.2.8. Security Attribute Expanded Length (SAE Len)

This byte indicates the length of the SAE structure that is included in the file header below.

4.2.9. DF Name Length / First Cyclic Record

If the file is a DF, this field indicates the length of the DF's Name.

If the file is a Cyclic EF, this field holds the index of the last-altered record.

Otherwise, this field is not used.

4.2.10. Parent Address

2 bytes indicating the physical EEPROM address of the file's parent DF.

4.2.11. Checksum

To maintain data integrity in the file header, a checksum is used by the COS. It is computed by XOR-ing all the preceding bytes in the header. Commands to a file will not be allowed if the file is found to have a wrong checksum.

4.2.12. Security Attribute Compact (SAC)

This is a data structure that represents security conditions for certain file actions. The data is coded in an "AM-SC" template as defined in ISO-7816. The maximum size of this field is 8 bytes. See Section 5.1.1 for more information.

4.2.13. Security Attribute Expanded (SAE)

This is a data structure that represents security conditions for certain card actions. The data is coded differently from SAC, and is also defined in ISO-7816. The maximum size of this field is 32 bytes. See Section 5.1.2 for more information.

For DF files, additional fields are included in the file header:

4.2.14. SE File ID (for DF only)

For DF, this field is made up of 2 bytes containing the File ID of one of its children. That file is known as the Security Environment File, which is processed internally by the COS.

4.2.15. FCI File ID (for DF only)

For DF, this field is made up of 2 bytes containing the File ID of one of its children. That file is known as the File Control Information File, which is processed internally by the COS.

4.2.16. DF Name (for DF only)

For DF, this field is the file's Long Name. Files can be selected through its long name - which can be up to 16 bytes.

4.3. Internal Security Files

The behavior of the COS will depend on the contents of the security-related internal files. When internal files are activated, its READ condition should be set to NEVER. Typically, a DF should have: (1) a Key File to hold PIN codes (referred as EF1) for verification, (2) a Key File to hold KEY codes (referred as EF2) for authentication, and (3) an SE file to hold security conditions.

A Key file is an Internal Linear Variable file. It may contain (1) PIN data structure or (2) KEY data structure.

Each unsuccessful attempt will decrement $CNT_{Remaining}$. A successful submission of the PIN number will reset the $CNT_{Remaining}$ to the $CNT_{Allowed}$. If the lower nibble reaches zero, then the PIN is locked and further PIN submission is not possible.

5.0. Security

File commands are restricted by the COS depending on the target file's (or current DF's) security Access Conditions. These conditions are based on PINs and KEYS being maintained by the system. Card Commands are allowed if certain PIN's or KEY's are submitted or authenticated.

Global PIN's are PINs that reside in a PIN EF (EF1) directly under the MF. Likewise, local Keys are KEYS that reside in a KEY EF (EF2) under the currently selected DF. There can be a maximum of: 31 Global PINs, 31 Local PINs, 31 Global Keys, and 31 Local Keys at a given time.

5.1. File Security Attributes

Each file (MF, DF, or EF) has a set of security attributes set in its headers. There are two types of security attributes Security Attribute Compact (SAC) and Security Attribute Expanded (SAE).

5.1.1. Compact (SAC)

The SAC is a data structure that resides in each file. It indicates what file actions are allowed on the file, and what conditions need to be satisfied for each action.

- The SE record is found in the SE file - whose ID is specified in the current DF's header.

5.1.2. Expanded (SAE)

The SAE is a data structure that resides in each file. It tells the COS whether or not to allow file commands to proceed. SAE is more general compared to SAC. The format of SAE is an access mode data object (AMDO) followed by one or more security condition data objects (SCDO).

5.2. Security Environment

Security conditions are coded in an SE File. Every DF has a designated SE FILE, whose file ID is indicated in the DF's header block. Each SE record has the following format:

<SE ID Template> <SE Authentication Template>

SE ID Template: The SE ID Template is a mandatory data object whose value states the identifier that is referenced by the SC byte of the SAC and SAE.

SE Authentication Template: The Authentication Template (AT) defines the security condition that must be meant for this SE to be satisfied. The security conditions are either PIN or Key authentications.

5.3. Mutual Authentication

Mutual Authentication is a process in which both the card and the card-accepting device verify that the respective entity is genuine. A *Session Key* is the result of a successful execution of mutual authentication. The session key is only valid during a *session*. A session is defined as the time after a successful execution of the mutual authentication procedure and a reset of the card or the execution of another mutual authentication procedure.

5.4. Short Key External Authentication

Short key external authentication uses a card challenge and terminal response method to gain authorization to the card. This allows for shorter external authentication or one-time-password that is more optimal for human input.

5.5. Secure Messaging for Authenticity (SM-MAC)

ACOS6-SAM supports two types of Secure Messaging - *Secure Messaging for Authenticity (SM-MAC)* and *Secure Messaging for Confidentiality (SM-ENC)*. This section discusses SM for Authentication while Section 5.6 discusses SM for confidentiality.

SM for Authentication allows data and command that is transferred into the card and vice versa to be authenticated. This ensured the command is not modified or replayed. Data blocks sent from the sender to the recipient are appended with 4 bytes of MAC. The receiver then verifies the MAC before proceeding with the operation. Before performing SM, both parties must first have a session key by performing mutual authentication in Section 5.3.

5.6. Secure Message for Confidentiality (SM-ENC)

ACOS6 Version 4.02 and above supports ISO secure messaging (SM). Secure messaging ensures data transmitted between the card and terminal/server is secured and not susceptible to eavesdropping, replay attack and unauthorized modifications. Almost all the command can also use secure messaging initiated by the terminal.

5.7. Key Injection

Key injection can be used to securely load a key or diversified key from an ACOS6-SAM card into a target ACOS6-SAM or client ACOS6 card. For the purpose of key injection, we shall refer to the ACOS6-SAM with the key to inject the “*source SAM*” and the ACOS6/ACOS6-SAM to receive the key the “*target SAM*”.

This function allows for a master and subordinate SAM relationships and the subordinate SAMs can perform different specific operations.

The target SAM cards uses the Set Key command and the source SAM will use the Get Key command to perform key injection. .

Note: The key injection feature is available for ACOS6-SAM revision 4.02 and ACOS6 revision 3.02 onwards.

6.0. Life Support Application

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. ACS customers using or selling these products for use in such applications do so on their own risk and agree to fully indemnify ACS for any damages resulting from such improper use or sale.

7.0. Contact Information
